The effects of three different levels of hyperbaric oxygen therapy were investigated in 24 untreated hypertensive patients aged from 25 to 67 years (mean 43.7). The following results were obtained: The first session of HDPO 20 min/100 atm, followed by 5 sessions per week, started on day 1 or day 8, decreases systolic and diastolic blood pressure by 23.2 +/- 11.4 and 18.9 +/- 8.1 mmHg, respectively. Although it is thought that the mechanism of HDPO is based on a decrease in the production of active oxygen, HDPO may have other mechanisms of action. The second session of HDPO 10 min/100 atm, followed by 5 sessions per week, start on day 8, decreases systolic and diastolic blood pressure by 5.0 +/- 5.0 and 3.4 +/- 5.4 mmHg, respectively. HDP 10 min/100 atm, followed by 5 sessions per week, started on day 1, decreases systolic and diastolic blood pressure f678ea9f9e
